

Using the Java API Documentation

J.1 Introduction

The Java class library contains thousands of predefined classes and interfaces that programmers can use to write their own applications. These classes are grouped into packages based on their functionality. For example, the classes and interfaces used for file processing are grouped into the `java.io` package, and the classes and interfaces for networking applications are grouped into the `java.net` package. The [Java API documentation](#) lists the public and protected members of each class and the public members of each interface in the Java class library. The documentation overviews all the classes and interfaces, summarizes their members (i.e., the fields, constructors and methods of classes, and the fields and methods of interfaces) and provides detailed descriptions of each member. Most Java programmers rely on this documentation when writing programs. Normally, programmers would search the API to find the following:

1. The package that contains a particular class or interface.
2. Relationships between a particular class or interface and other classes and interfaces.
3. Class or interface constants—normally declared as `public static final` fields.
4. Constructors to determine how an object of the class can be initialized.
5. The methods of a class to determine whether they are `static` or non-`static`, the number and types of the arguments you need to pass, the return types and any exceptions that might be thrown from the method.

In addition, programmers often rely on the documentation to discover classes and interfaces that they have not used before. For this reason, we demonstrate the documentation with classes you know and classes you may not have studied yet. We show how to use the documentation to locate the information you need to use a class or interface effectively.

J.2 Navigating the Java API

The Java API documentation can be downloaded to your local hard disk or viewed online. To download the Java API documentation, go to `java.sun.com/javase/6/download.jsp` and locate the **DOWNLOAD** link in the **Java SE 6 Documentation** section. You'll be asked to accept a license agreement. To do this, click **Accept**, then click **Continue**. Click the **Java(TM) SE Development Kit Documentation 6** link to begin the download. After downloading the file, you can use a ZIP file-extraction program, such as WinZip (www.winzip.com), to extract the files. If you are using Windows, extract the contents to your JDK's installation directory. (See the *Before You Begin* section of this book for information on installing Java.) To view the API documentation on your local hard disk in Microsoft Windows, open `C:\Program Files\Java\jdk1.6.0\docs\api\index.html` page in your browser. To view the API documentation on line, go to `java.sun.com/javase/6/docs/api/index.html` (Fig. J.1). [Note: We released this book to publication several days before the final Java SE 6 API documentation became available, so all the screen captures presented here are based on the release candidate documentation.]

Frames in the API Documentation's *index.html* Page

The API documentation is divided into three frames (see Fig. J.1). The upper-left frame lists all of the Java API's packages in alphabetical order. The lower-left frame initially lists the Java API's classes and interfaces in alphabetical order. Interface names are displayed in italic. When you click a specific package in the upper-left frame, the lower-left frame lists the classes and interfaces of the selected package. The right frame initially provides a brief description of each package of the Java API specification—read this overview to become familiar with the general capabilities of the Java APIs. If you select a class or interface in the lower-left frame, the right frame displays information about that class or interface.

Important Links in the *index.html* Page

At the top of the right frame (Fig. J.1), there are four links—**Tree**, **Deprecated**, **Index** and **Help**. The **Tree** link displays the hierarchy of all packages, classes and interfaces in a tree structure. The **Deprecated** link displays interfaces, classes, exceptions, fields, constructors and methods that should no longer be used. The **Index** link displays classes, interfaces, fields, constructors and methods in alphabetical order. The **Help** link describes how the API documentation is organized. You should probably begin by reading the **Help** page.

Viewing the Index Page

If you do not know the name of the class you are looking for, but you do know the name of a method or field, you can use the documentation's index to locate the class. The **Index** link is located near the upper-right corner of the right frame. The index page (Fig. J.2) displays fields, constructors, methods, interfaces and classes in alphabetical order. For example, if you are looking for Scanner method `hasNextInt`, but do not know the class name,

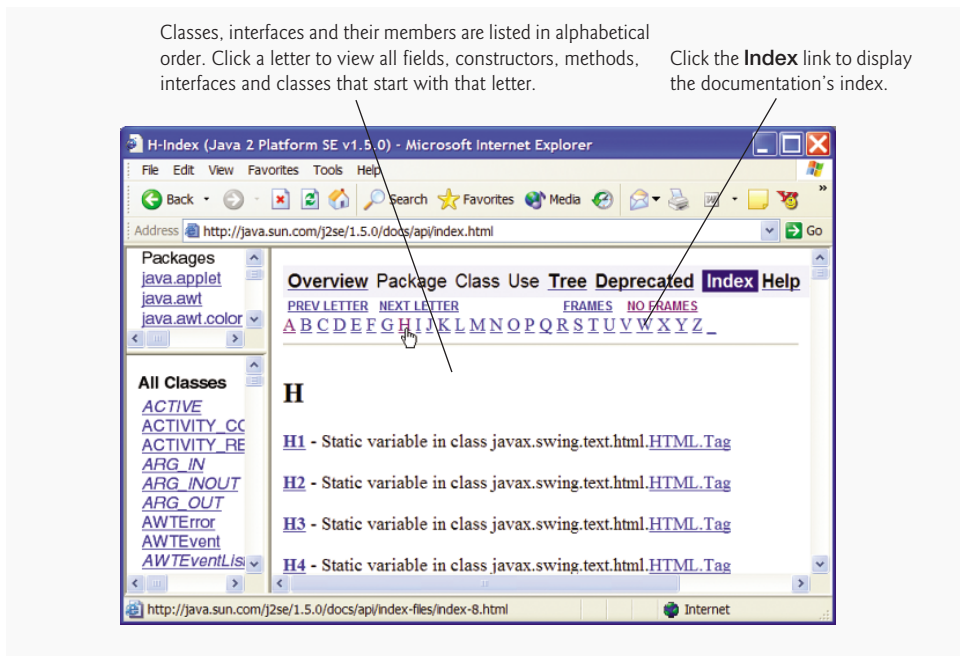

Fig. J.2 | Viewing the **Index** page. (Courtesy of Sun Microsystems, Inc.)

you can click the **H** link to go to the alphabetical listing of all items in the Java API that begin with "h". Scroll to method `hasNextInt` (Fig. J.3). Once there, each method named `hasNextInt` is listed with the package name and class to which the method belongs. From there, you can click the class name to view the class's complete details, or you can click the method name to view the method's details.

Viewing a Specific Package

When you click the package name in the upper-left frame, all classes and interfaces from that package are displayed in the lower-left frame and are divided into five subsections—**Interfaces**, **Classes**, **Enums**, **Exceptions** and **Errors**—each listed alphabetically. For example, the contents of package `javax.swing` are displayed in the lower-left frame (Fig. J.4)

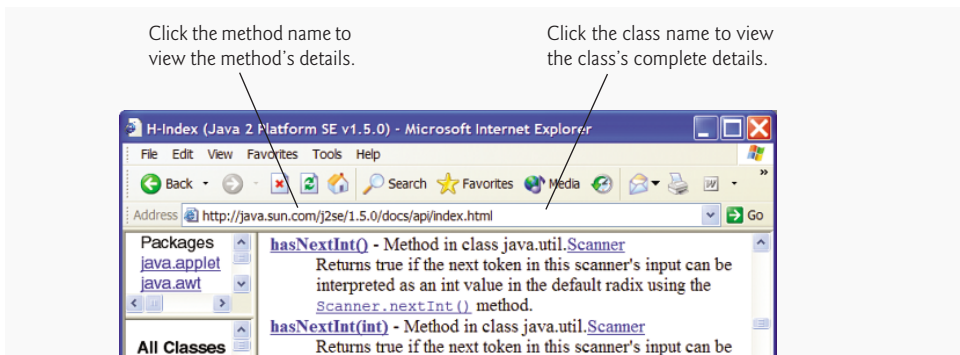

Fig. J.3 | Scroll to method `hasNextInt`. (Courtesy of Sun Microsystems, Inc.)

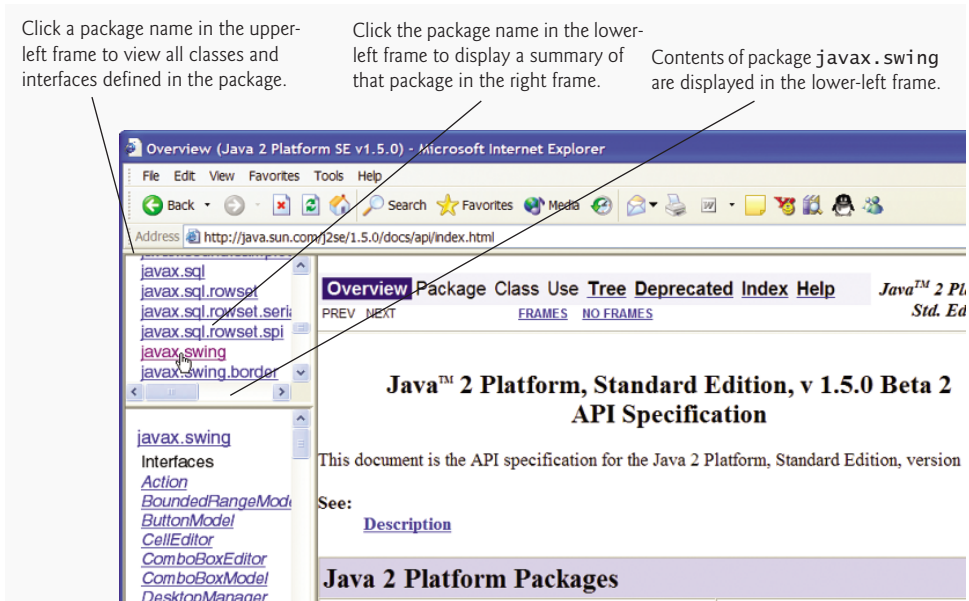

Fig. J.4 | Clicking a package name in the upper-left frame to view all classes and interfaces declared in this package. (Courtesy of Sun Microsystems, Inc.)

when you click `javax.swing` in the upper-left frame. You can click the package name in the lower-left frame to get an overview of the package. If you think that a package contains several classes that could be useful in your application, the package overview can be especially helpful.

Viewing the Details of a Class

When you click a class name or interface name in the lower-left frame, the right frame displays the details of that class or interface. First you will see the class's package name followed by a hierarchy that shows the class's relationship to other classes. You will also see a list of the interfaces implemented by the class and the class's known subclasses. Figure J.5 shows the beginning of the documentation page for class `JButton` from the `javax.swing` package. The page first shows the package name in which the class appears. This is followed by the

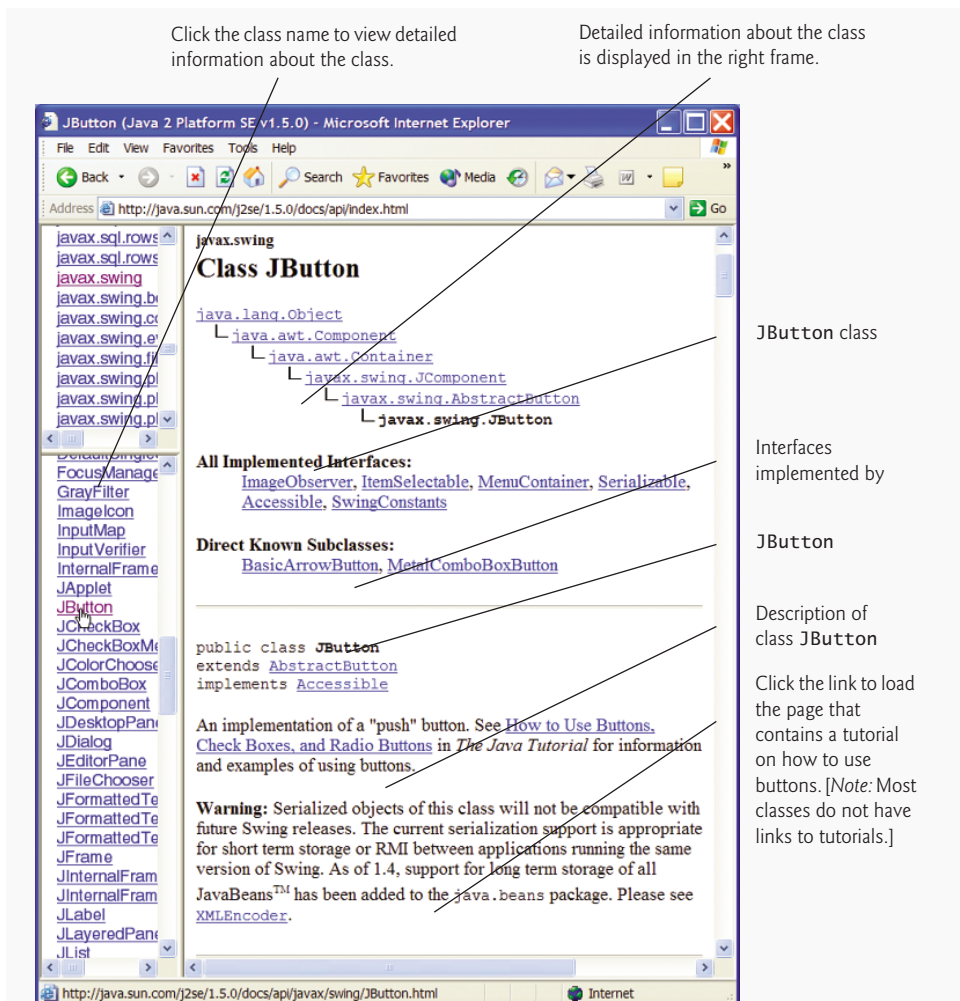

Fig. J.5 | Clicking a class name to view detailed information about the class. (Courtesy of Sun Microsystems, Inc.)

class hierarchy that leads to class `JButton`, the interfaces class `JButton` implements and the subclasses of class `JButton`. The bottom of the right frame shows the beginning of class `JButton`'s description. Note that when you look at the documentation for an interface, the right frame does not display a hierarchy for that interface. Instead, the right frame lists the interface's superinterfaces, known subinterfaces and known implementing classes.

Summary Sections in a Class's Documentation Page

Other parts of each API page are listed below. Each part is presented only if the class contains or inherits the items specified. Class members shown in the summary sections are `public` unless they are explicitly marked as `protected`. A class's `private` members are not shown in the documentation, because they cannot be used directly in your programs.

1. The **Nested Class Summary** section summarizes the class's `public` and `protected` nested classes—i.e., classes that are defined inside the class. Unless explicitly specified, these classes are `public` and `non-static`.
2. The **Field Summary** section summarizes the class's `public` and `protected` fields. Unless explicitly specified, these fields are `public` and `non-static`. Figure J.6 shows the **Field Summary** section of class `Color`.
3. The **Constructor Summary** section summarizes the class's constructors. Constructors are not inherited, so this section appears in the documentation for a class only if the class declares one or more constructors. Figure J.7 shows the **Constructor Summary** section of class `JButton`.
4. The **Method Summary** section summarizes the class's `public` and `protected` methods. Unless explicitly specified, these methods are `public` and `non-static`. Figure J.8 shows the **Method Summary** section of class `BufferedInputStream`.

Note that the summary sections typically provide only a one-sentence description of a class member. Additional details are presented in the detail sections discussed next.

Detail Sections in a Class's Documentation Page

After the summary sections are detail sections that normally provide more discussion of particular class members. There is not a detail section for nested classes. When you click the link in the **Nested Class Summary** for a particular nested class, a documentation page describing that nested class is displayed. The detail sections are described below.

1. The **Field Detail** section provides the declaration of each field. It also discusses each field, including the field's modifiers and meaning. Figure J.9 shows the **Field Detail** section of class `Color`.

Field Detail
section describes
the purpose of

Fig. J.9 | Field Detail section of class `Color`. (Courtesy of Sun Microsystems, Inc.)

2. The **Constructor Detail** section provides the first line of each constructor's declaration and discusses the constructors. The discussion includes the modifiers of each constructor, a description of each constructor, each constructor's parameters and any exceptions thrown by each constructor. Figure J.10 shows the **Constructor Detail** section of class `JButton`.
3. The **Method Detail** section provides the first line of each method. The discussion of each method includes its modifiers, a more complete method description, the method's parameters, the method's return type and any exceptions thrown by the method. Figure J.11 shows the **Method Detail** section of class `BufferedInputStream`. The method details show you other methods that might be of interest (labeled as **See Also**). If the method overrides a method of the superclass, the name of the superclass method and the name of the superclass are provided so you can link to the method or superclass for more information.

As you look through the documentation, you will notice that there are often links to other fields, methods, nested-classes and top-level classes. These links enable you to jump from the class you are looking at to another relevant portion of the documentation.
